Where are the applications that are still "alive" sitting right now?

1a. Application Status Pipeline

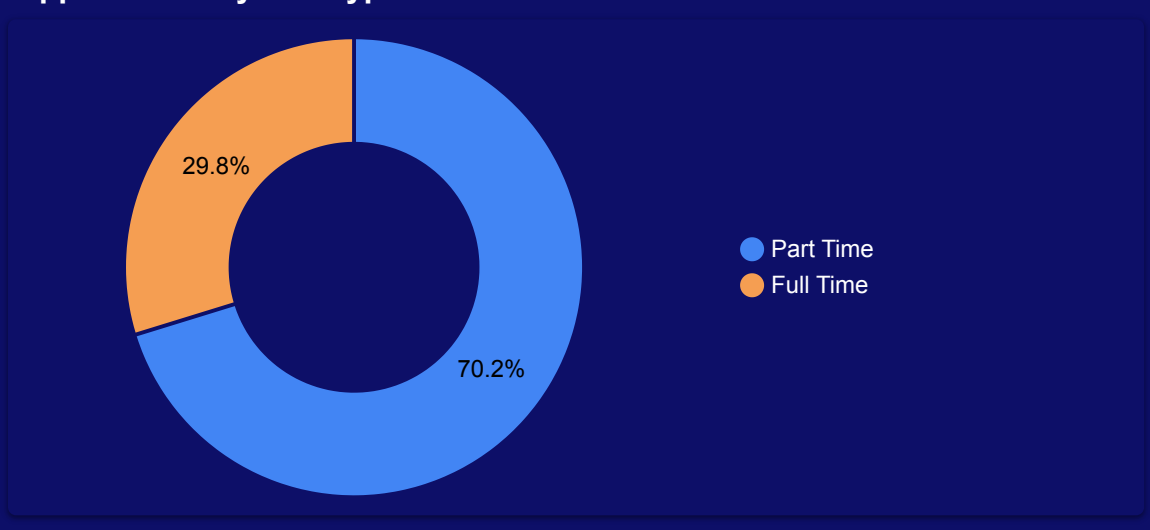

How many applications actually leave the pipeline without getting hired — and why?

1b. Pipeline Exits

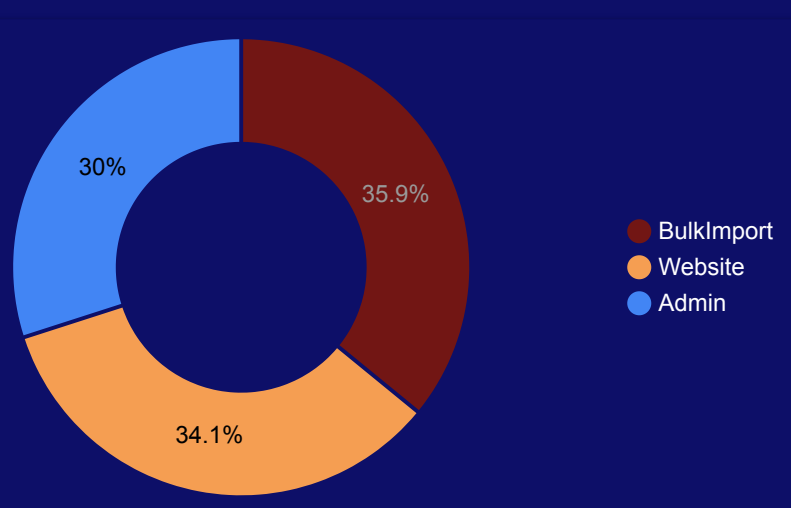

Are we hiring more Full Time or Part Time roles?

Applications by Job Type

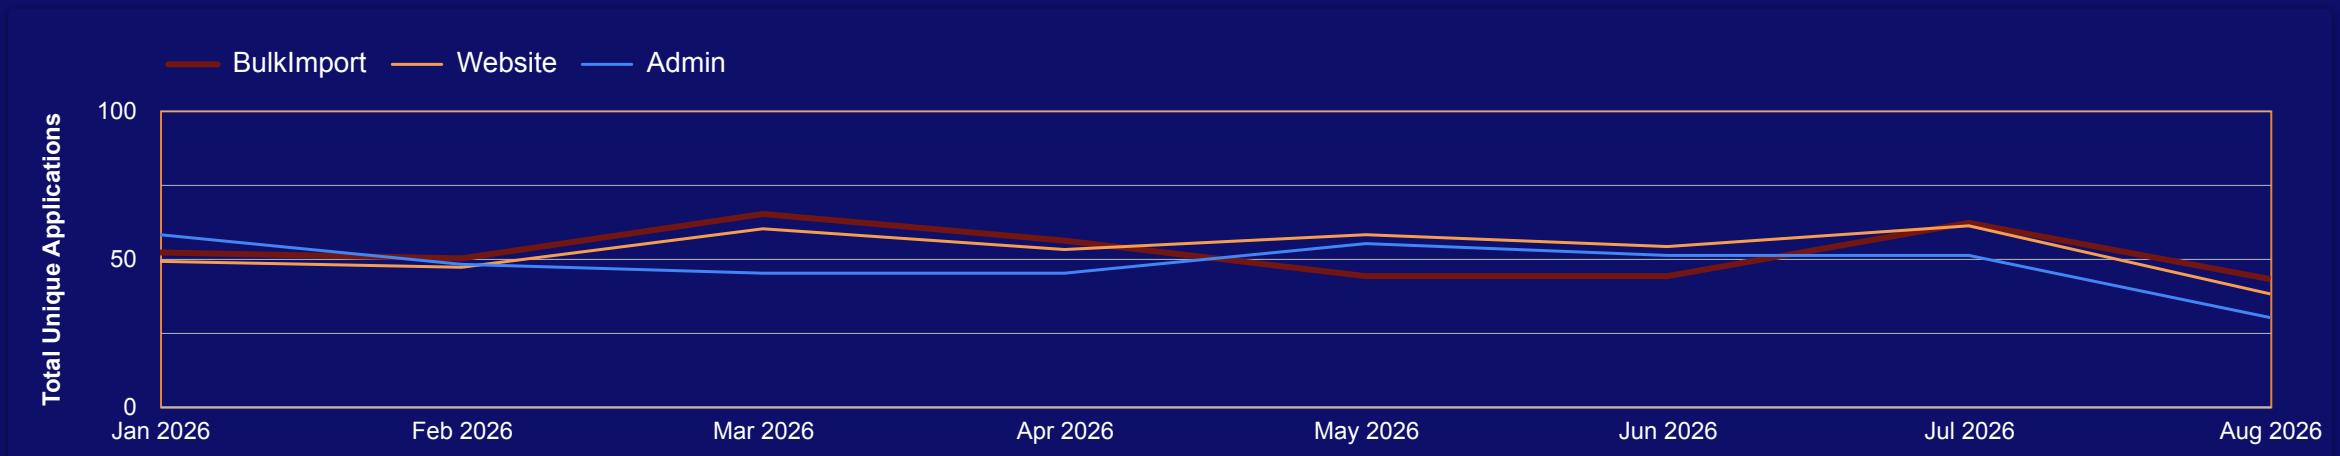

Which channel brings in the most applications — and are we too dependent on one?

Application Source

Is application volume growing, shrinking, or steady over time?

Application Source Trend over Time

Recruitment Pipeline Overview

Pipeline Position
This section shows how applications are distributed across the different stages of the recruitment process. The largest number of applications is currently at the Applicant stage, indicating where most candidates are positioned and where the greatest recruitment activity is taking place.

Candidate Progression
Applications that do not continue through the recruitment process are highlighted through the pipeline exit analysis. 27.78% of the filtered applications fall into exit or non-progressing outcomes, with Rejected representing the largest group. This helps identify where candidate progression is most frequently interrupted.

Demand and Acquisition
Application distribution provides insight into both candidate demand and recruitment channels. Part Time represents the largest share of applications by job type, while BulkImport is the leading source of candidate applications. Together, these results show which employment opportunities attract the most interest and which channels contribute the most candidates.

Recruitment Trends
Application trends show how candidate inflow changes throughout the selected period. The highest application volume was recorded in Jul 2026, while BulkImport remains a major contributor to the overall pipeline. The trend over time helps identify periods of increasing, decreasing, or fluctuating recruitment activity.
