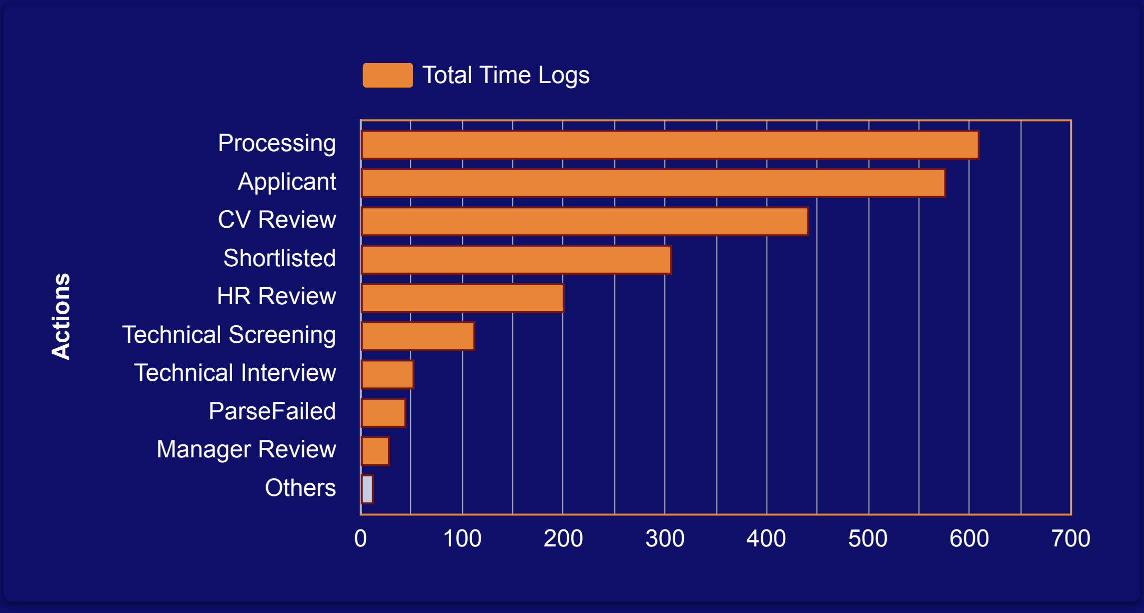
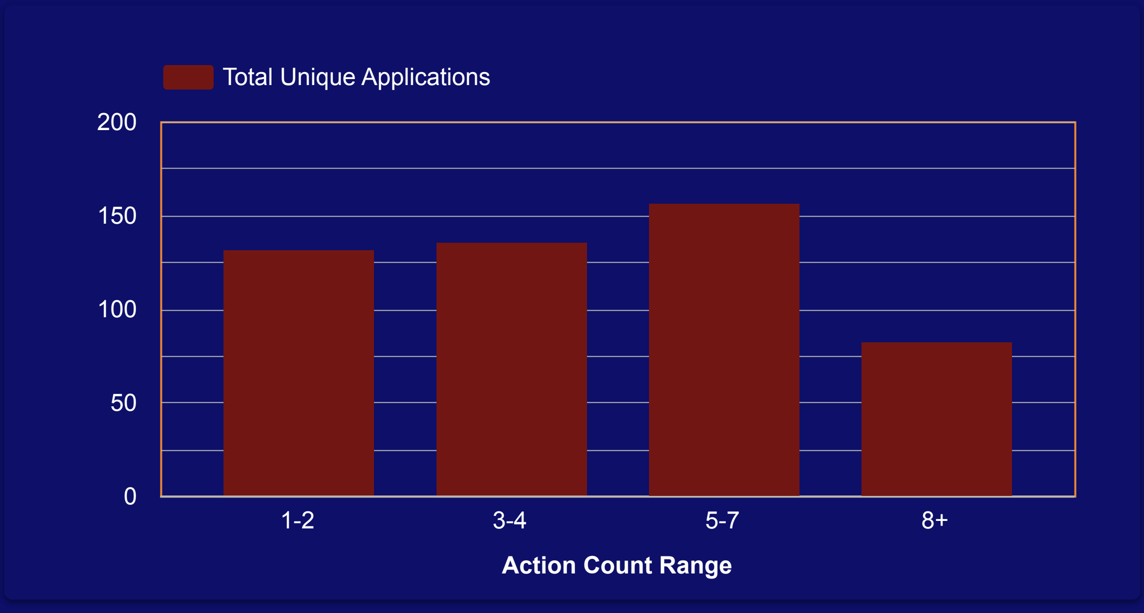
How often each action happens?

Sessions by Action



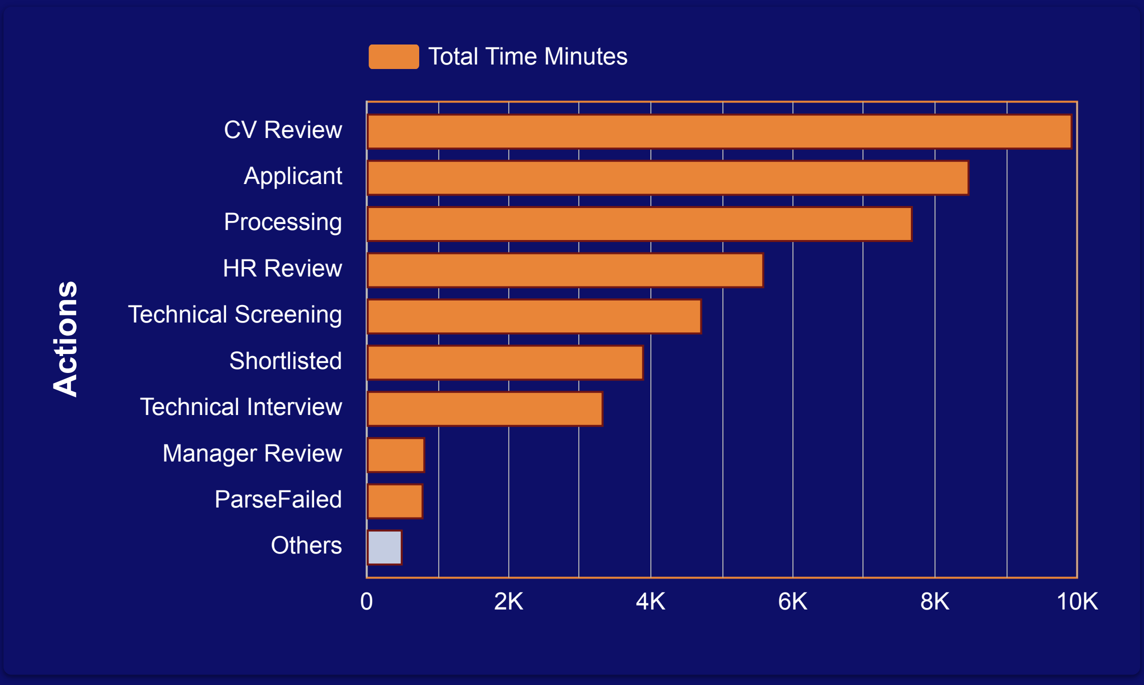
How much handling does a typical application actually need before reaching its current status?

Actions per Application Distribution



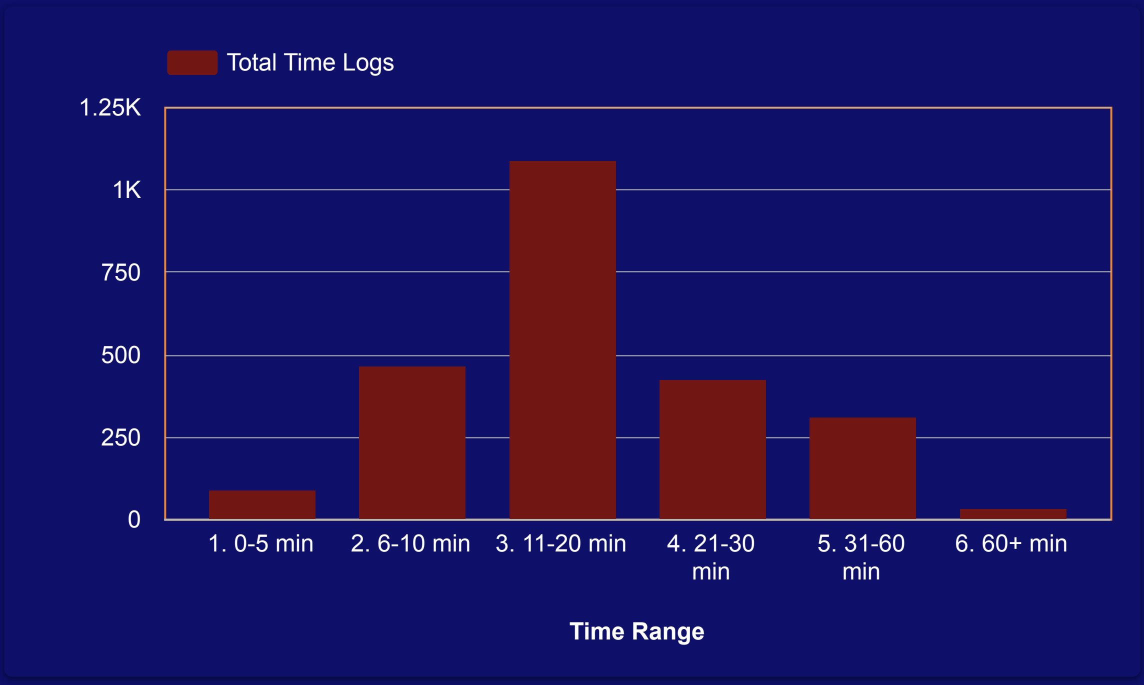
Where total effort concentrates?

Actions Taking the Most Time



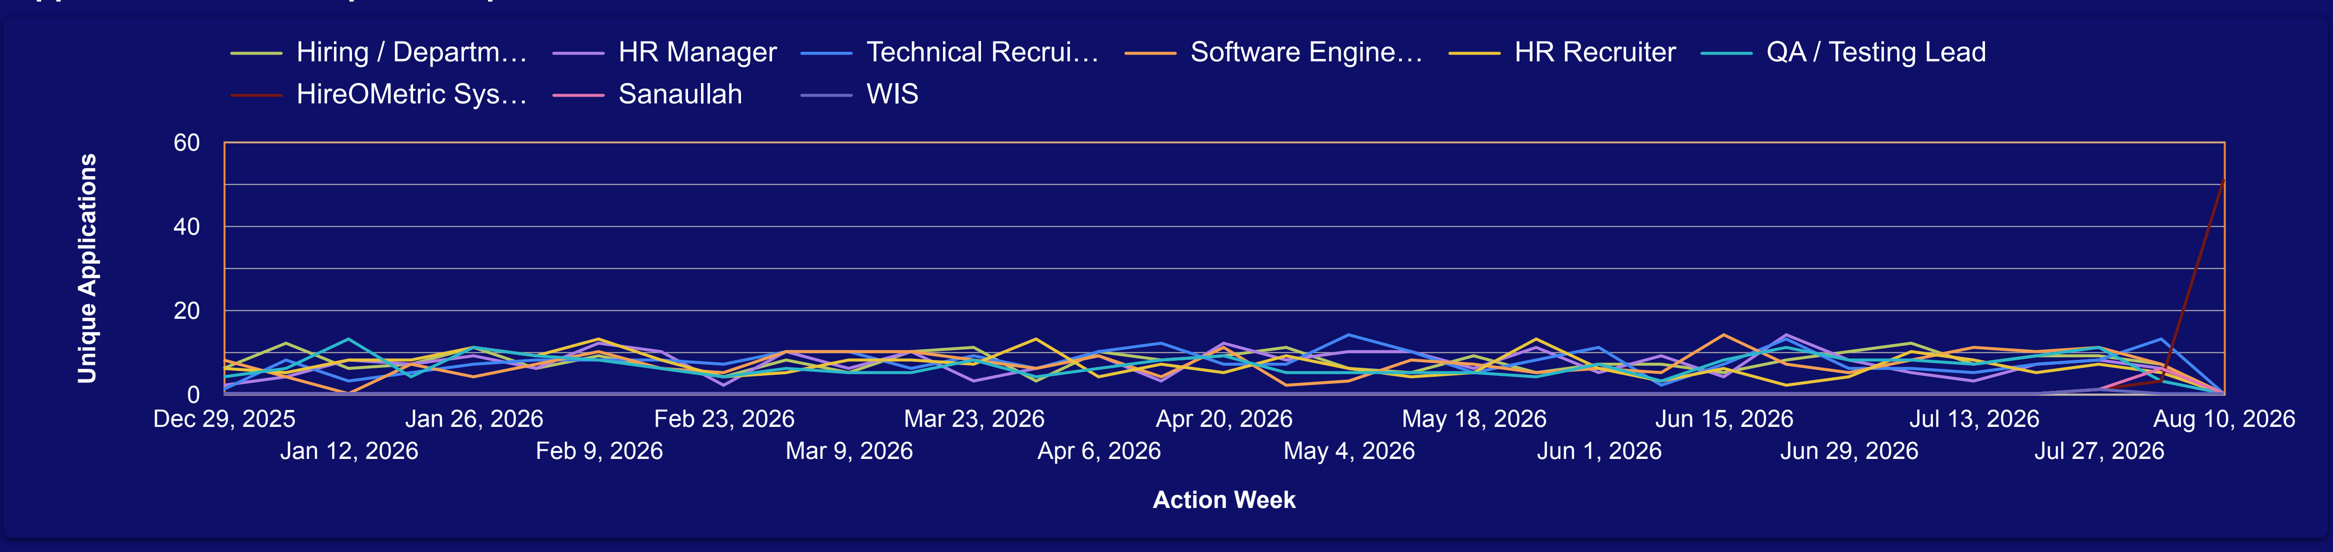
Typical process complexity?

Session Time Distribution



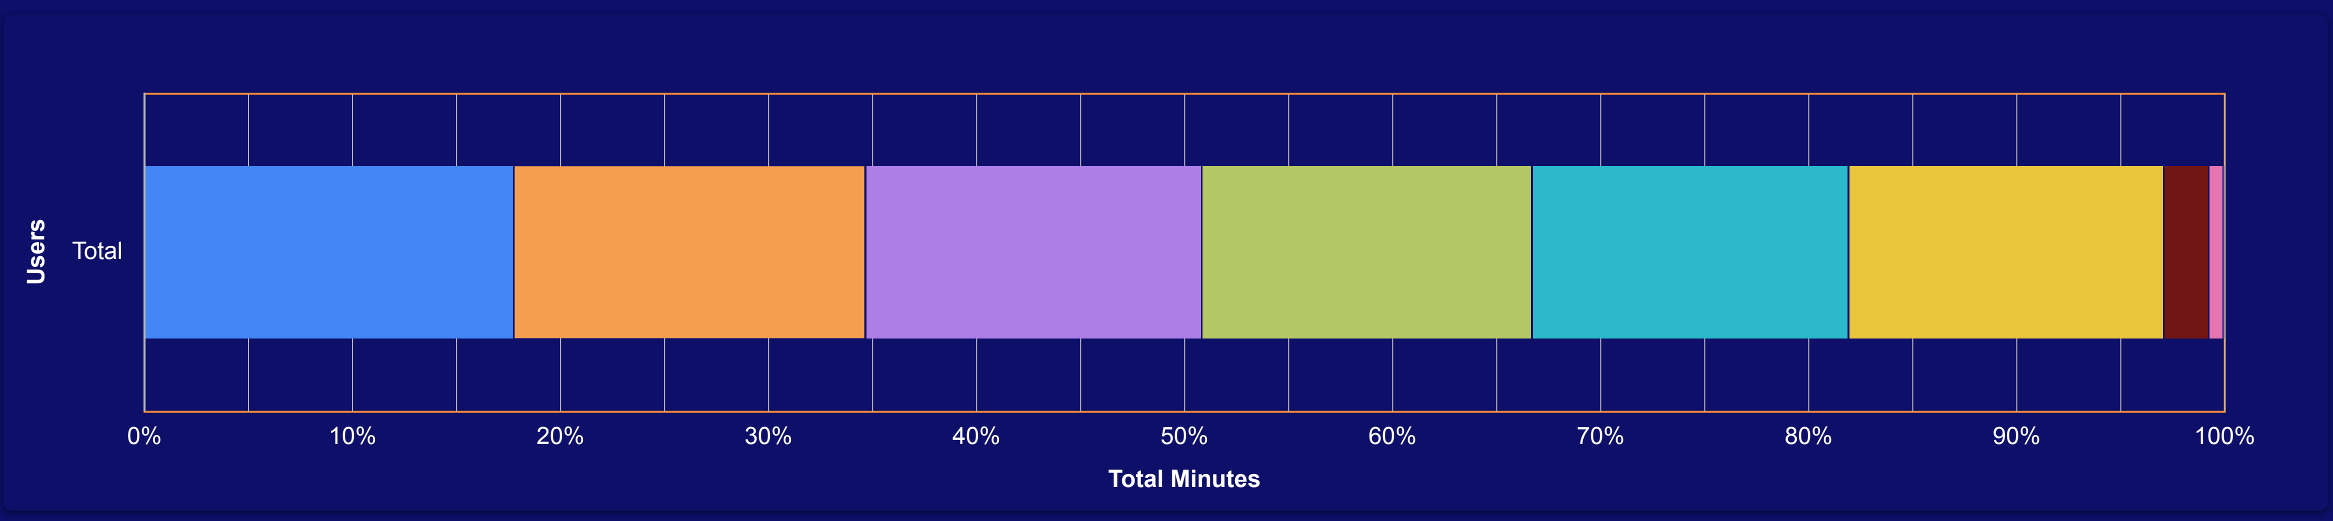
Capacity and volume trend by person?

Applications Handled per User per Week



Is the team's effort spread out fairly, or is it quietly resting on just a couple of people's shoulders?

Workload Concentration



User & Action Workload: Who's Doing the Work, and How Much?

Workload Volume
The highest session volume is recorded by Technical Recruiter, with 436 logged sessions. This identifies the team member currently handling the largest volume of recorded activity within the selected period.

Effort vs. Frequency
Processing is the most frequently performed action, while CV Review accounts for the greatest total time spent. This shows that frequently performed actions are not necessarily the most time-intensive activities.

Typical Work Pattern
Session and application activity distributions provide insight into typical operational behaviour. 11–20 minutes represents the most common session duration range, while 5–7 actions represents the most common level of activity required per application.

Workload Distribution
Workload is distributed across 9 active team members. Technical Recruiter records the highest total logged workload, with 8,126 recorded during the selected period.

Individual Handling Patterns
Handling times vary across users and actions. The highest average handling time is recorded by Technical Recruiter for Technical Interview, highlighting an area where individual processing patterns differ and may require further analysis.

Operational Timing
Recorded activity is highest around Tuesday at 3PM, identifying the period with the greatest concentration of logged sessions during the selected timeframe and helping highlight periods of increased operational activity.
