Human vs AI & Time-State Analysis: Precise Summary

Human vs. AI Workload
The recruitment workflow is currently predominantly human-driven: 97.66% of recorded sessions are associated with human users, compared with 2.34% for the HireOMetric system.

Time Investment
Human users account for 97.84% of recorded activity time, while AI accounts for 2.16%. The largest concentration of recorded time occurs in CV Review, accounting for 9,937 minutes.

Session Efficiency
A typical human session lasts 19.2 minutes, compared with 17.7 minutes for a HireOMetric session, a difference of 1.5 minutes.

Where AI Supports the Workflow
AI involvement is concentrated most strongly at ParseFailed, where 100% of recorded activity is associated with the system. This indicates that AI involvement is concentrated in specific workflow activities rather than being evenly distributed across the recruitment process.

AI Involvement & Hiring Outcomes
At the application level, AI-Touched applications have a 5.56% hiring rate compared with 12.44% for Human-Only applications — a difference of -6.89% percentage points lower. This provides an indication of how hiring outcomes differ between applications with and without recorded AI involvement.
