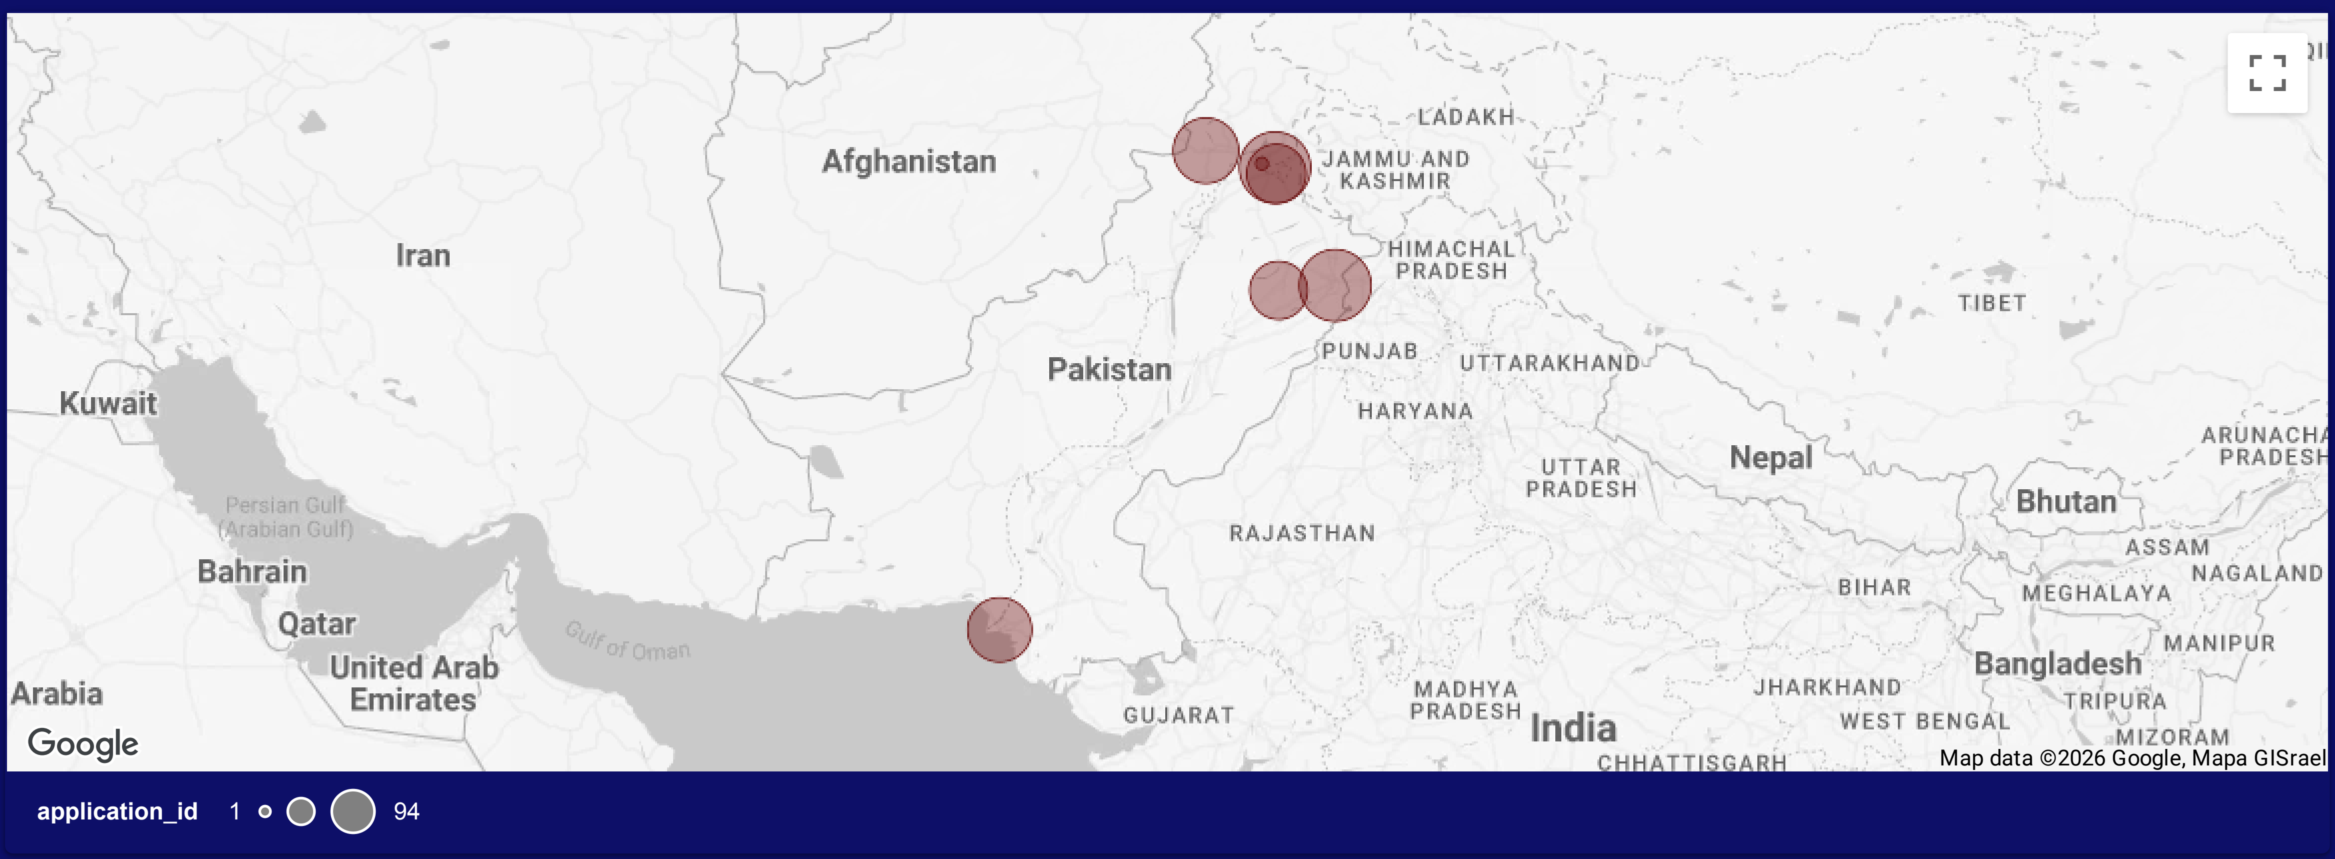
Where candidates are physically located

Applications by City



Who is applying, and from where?

Candidate Geography and Role Demand
Candidate applications are distributed across multiple cities, providing insight into where recruitment demand and candidate availability are concentrated. Lahore contributes the highest number of applications with 94 applications recorded. while the role-and-city analysis shows how application demand varies across locations and job opportunities. At the role level, Senior Software Engineer — Karachi stands out as the top individual role-city combination, drawing 16 applications on its own.Together, these two views help separate where candidates are coming from (city-level supply) from where demand is strongest for a specific role (role-and-city combination) — useful for deciding where to focus sourcing efforts.

Gender Distribution Across Roles
Female candidates are the most represented gender across the applicant pool, accounting for 265 applications — more than any other gender category recorded. This distribution holds fairly consistently across roles rather than being concentrated in one or two job types, suggesting the applicant pool's gender balance isn't being driven by a single high-volume position.

Experience and Recruitment Progression
Candidate experience provides insight into how different experience levels move through the recruitment process. The 5-8 yrs experience band generates the strongest activity, with 210 applications — the highest of any experience band.

Education and Application Outcomes
The degree-level analysis shows how recruitment outcomes are distributed across different educational backgrounds. MS Computer Science is the most common degree among applicants, appearing in 89 applications. Variations in application status by degree provide context on whether certain qualification groups appear more frequently at particular stages of the recruitment process. These patterns should be interpreted alongside application volume, as larger candidate groups may naturally generate higher counts across all outcomes.

Local and Cross-City Recruitment
Candidate and job locations provide insight into the geographic reach of recruitment activity. 16.67% of applications involve candidates applying for opportunities located in their own city, while the remaining applications represent cross-city recruitment activity. The strongest individual cross-city pairing is Rawalpindi → Islamabad. The location comparison highlights which candidate and job city combinations generate the highest application volume and shows how widely recruitment demand extends beyond local markets.
