Based on synthetic demo timestamps — not representative of real hiring velocity

Time-to-Hire Trend

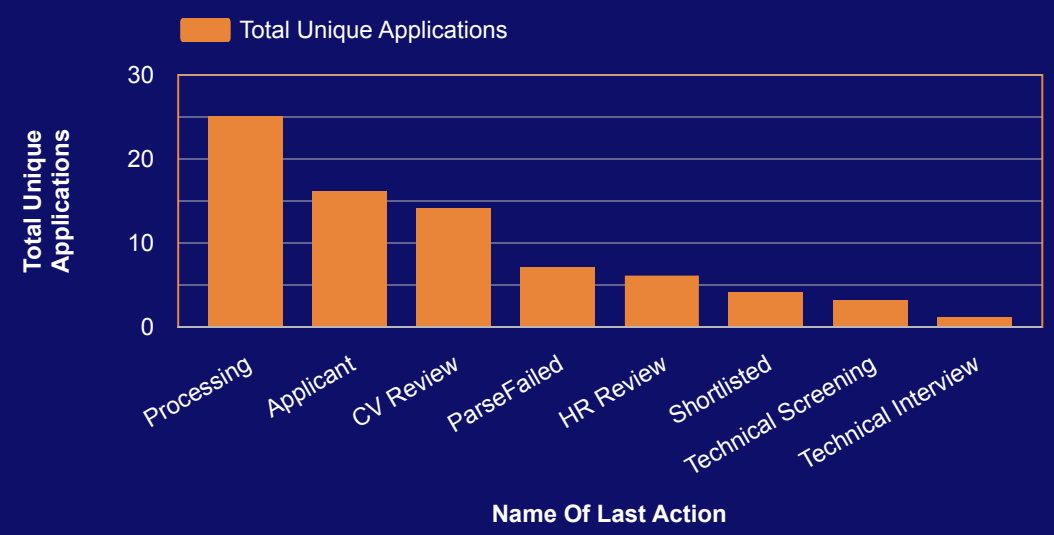

Which specific transition takes the longest

Stage-to-Stage Duration

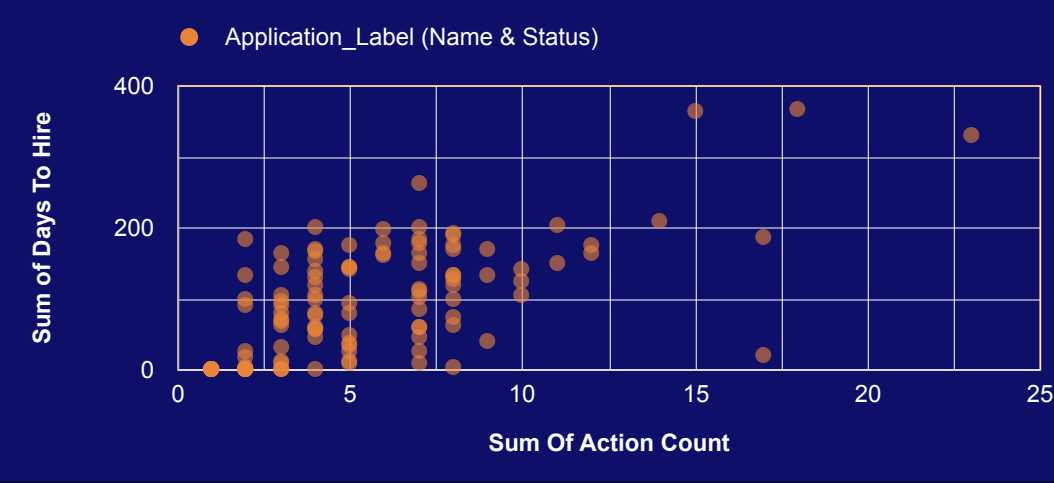

Where in the pipeline rejected candidates were sitting last

Rejection by Last Stage Reached

Do more process steps mean a slower hire?

Application Complexity vs Hiring Time

Is hiring speed trending up or down over time, and what are the actual reasons behind rejections/delays?

Hiring Timeline Pattern
Median time to hire varies across the recorded timeline, reaching its highest recorded level in January at 150 days. Because the timestamps are synthetic, this pattern should be interpreted as an illustration of time-based analysis rather than real hiring-velocity performance.

Rejection by Last Stage
Candidate rejection is concentrated at Processing stage, which records 25 rejected applications out of 76. This indicates where the largest volume of candidate attrition is occurring within the recorded recruitment pipeline.

Stage-to-Stage Duration
ParseFailed has the longest average stage duration at 68.7 days. This is the stage where the recruitment process is taking the most time and may need closer attention.

Application Complexity vs Hiring Time
The relationship between application activity and hiring time: applications requiring more actions generally take longer to complete, while lower-action applications tend to have shorter processing times. The relationship may vary across different filters and application outcomes.
