Full Time vs Part Time, side by side

Job Type Performance

	job_type	Jobs	Applications	Candidates	Hires	Hiring Rate (%)	Median Days to Hire	Avg Time/App
1.	Part Time	6	354	354	41	11.58%	70	88.47
2.	Full Time	6	150	146	18	12%	93.5	96.55

1 - 2 / 2

Volume tells you where applications come from — this tells you which sources actually convert

Source Performance

	Source	Applications	Hires	Hire Rate (%)	Median Hiring Time	ParseFailed Rate (%)
1.	BulkImport	181	24	13.26%	77	6.63%
2.	Website	172	14	8.14%	71	11.05%
3.	Admin	151	21	13.91%	98	6.62%

1 - 3 / 3

Volume by city, from Section 7, doesn't tell you which cities actually convert — this does

City Performance

	Candidate City	Applications	Total Hires	Hire Rate (%)	Median Days to Hire
1.	Lahore	94	8	8.51%	9
2.	Islamabad	93	11	11.83%	75.5
3.	Peshawar	84	8	9.52%	96.5
4.	Karachi	82	8	9.76%	24
5.	Rawalpindi	74	11	14.86%	114
6.	Faisalabad	72	13	18.06%	90.5
7.	Not Provided	4	0	0%	null
8.	Wah Cantt	1	0	0%	null

1 - 8 / 8

Which job type, source, and city actually convert — not just which brings the most volume?

Job Type Performance
Application volume alone does not determine recruitment success. Part Time generates the highest number of applications, while Full Time records the strongest hiring rate at 12%. Comparing recruitment volume with hiring outcomes and processing time provides a clearer view of which job types attract the most candidates and which convert those applications into successful hires most effectively.

Recruitment Efficiency by Job Type
Recruitment efficiency also varies between job types. Part Time has the shortest median hiring time , while Full Time requires the longest time to reach a hiring outcome. In terms of operational effort, Full Time requires the highest average staff time per application at 96.55, helping distinguish high-volume recruitment activity from processes that require greater staff effort.

Recruitment Source Effectiveness
Recruitment sources differ not only in the number of applications they generate but also in the quality and conversion of those applications. BulkImport contributes the highest application volume, while Admin achieves the strongest hiring rate at 13.91%. This comparison helps distinguish high-volume sources from sources that are more effective at converting candidates into successful hires.

Source Quality and Processing Efficiency
Source performance should also be evaluated alongside recruitment speed and application quality. Website records the shortest median hiring time, while Website has the highest ParseFailed rate at 11.05%. Together, these measures help identify sources that generate efficient, high-quality candidate pipelines as well as sources that may require additional screening or process improvement.

Geographic Recruitment Performance
Candidate application volume varies across cities, but higher volume does not necessarily result in stronger hiring outcomes. Lahore contributes the highest number of applications, while Faisalabad records the strongest hiring rate at 18.06%. This distinction helps identify locations that generate the largest candidate pools versus those that produce the most successful recruitment outcomes.

Hiring Speed by Location
Recruitment timelines also differ across candidate locations. Lahore has the shortest median days to hire at 9, while other locations require longer recruitment cycles. Monitoring these differences helps identify geographic areas where candidates progress through the recruitment process more efficiently and where additional process attention may be required.

Volume, Conversion, and Efficiency
Overall recruitment performance should be evaluated through three perspectives: volume, conversion, and efficiency. High application volume indicates where candidate interest is concentrated, while hiring rate shows which segments convert that interest into successful outcomes. Median hiring time provides an additional efficiency perspective by showing how quickly successful recruitment decisions are reached. Together, the job type, source, and city analyses help identify where recruitment activity is strongest, where conversion is most effective, and where the recruitment process operates most efficiently.
